

Audit Trail

7-Member Team Work Distribution — Event-Sourced Inventory & Logistics Ledger

Project Team Overview

The Audit Trail project is being developed by a seven-member team. Each member has a dedicated responsibility covering project leadership and GitHub integration, backend Commands and Queries, MongoDB/Event Store, React UI, shipment search, and documentation/testing.

1. Team Work Distribution

Team Member	Assigned Responsibility	Primary Area
Rupal Pandey	Team Lead, GitHub management, code integration, and Pull Requests.	Team / GitHub
Somu Swarnamai	Query APIs and shipment history.	Backend — Queries
Nithin Reddy	Command APIs such as create, update, and event operations.	Backend — Commands
Gauri Pandey	React dashboard and UI components.	Frontend — Dashboard
Nandkishor Khobrekar	Documentation, README, and testing.	Documentation / QA
Divya Bhandakkar	MongoDB setup and Event Store.	Database / Event Store
Saniya Sahu	Search UI and shipment search functionality.	Frontend — Search

2. Team Responsibility Tree

3. Responsibility Flow

Area	Members	How Their Work Connects
Project / Integration	Rupal	Coordinates the team, manages GitHub, integrates changes, and handles Pull Requests.
Command Side	Nithin	Builds the write-side APIs that create/update shipment-related events and perform event operations.
Query Side	Somu	Builds read-side APIs and shipment history functionality.
Database / Event Store	Divya	Provides MongoDB setup and the Event Store used by the event-sourced backend.
Dashboard	Gauri	Builds the React dashboard and reusable UI components.
Search	Saniya	Builds shipment search UI and search functionality.
Documentation / QA	Nandkishor	Documents the project, maintains README content, and tests the integrated functionality.

4. Key Collaboration Dependency

The seven responsibilities are connected. Nithin's Command APIs and Divya's Event Store form the main write-side foundation. Somu's Query APIs consume the stored/projected information for shipment history. Gauri and Saniya use these backend capabilities to provide the dashboard and search experience. Rupal integrates the individual branches through the GitHub workflow. Nandkishor validates the integrated system through documentation and testing.
